

A word of advice - This exam is a real pain in the ass because the INAV MILs and CAIs assume that we remember everything from RI ground school in primary. In other words, they don't prepare you very well for the type of questions you will see. This gouge is good, but be very familiar with all your pubs and how to look things up in them.

—• SID's - encouraged but *not* required on DD-175

—• Know what takeoff mins are when a precision approach is available for the duty runway *200% or published mins, whichever is higher*

—• If in GCA pattern w/in 25 nm of field and you go NORDO - climb to Minimum Safe Altitude depicted on approach plate

—• 35 nm SE of Montgomery and you go NORDO when switching to new ARTTC - attempt to contact Center on 319.1

—• Know different types of radial intercepts - the question defines one and then you have to identify the right type of intercept from a list of all of them

—• Ground Speed calculation - # of miles $\times$ 60 if timed for 1 min
 30 " " 2 min
 20 " " 3 min

—• Between 328 radial and 358 radial at NMM remain at 3000 ft

—• What does an asterisk (*) next to an ATIS freq mean?
** before lightning station -> operates on prior freq?*
 That particular ATIS freq operates non-continuously

—• What do you do if you go NORDO while enroute?
 Maintain assigned alt for the current route segment and then MSA if higher

—• Know the symbol for PAPI lights (can be found in the IFR Supp) *White, Red, Red, White*
 —• When has an approach officially started?
 At the initial penetration altitude at the IAF

—• Be able to calculate arc-to-radial lead points and vice-versa

—• If cleared for the approach are you cleared to land as well? No

response: 4"

Good rating
 Non-prec mins but AT LT 300-1
 ATB min with NLT 200-1/2
Forms
 Enclosing mins - else 1000-3
